

# Information Sharing Solutions

In today's world of heightened public safety, the demand for wide-ranging tactical crime data has never been greater. In response to this demand, Denali enthusiastically and aggressively supports information sharing initiatives. We have created and implemented technology solutions that facilitate information sharing across jurisdictional boundaries, allowing law enforcement and public safety agencies to take a proactive approach to community safety.

## Regional RMS Solution

Denali's Regional RMS solution facilitates inter-agency data sharing. In addition to increasing law enforcement's effectiveness, the Regional RMS solution allows participating agencies to leverage staffing and technology resources. By sharing hardware, software licenses, interface development costs, and maintenance and operating costs, participating agencies can maximize both cost savings and technical capabilities.

## The Regional RMS Solution Offers Participating Agencies:

- Security – Each agency maintains its own RMS within its own secure database instance.
- Control – Agencies can choose the data they wish to share with other participating agencies at the individual record level. Data is migrated to the Regional RMS database, according to the rules defined by each agency.
- Ease-of-use – The user interface is exactly the same on the individual agency RMS as on the Regional RMS, eliminating the need to learn two systems.
- Scalability – Additional servers can easily be added to support additional agencies.

## Information Sharing Solutions

- **Cost Savings** – By pooling resources to share hardware, software licenses, and system maintenance and training resources, participating agencies can realize significant cost savings.

### Regional Data Warehouse Solution

In support of another regional data sharing initiative, Denali has implemented a Regional Data Warehouse solution, which provides:

- **External System Interface Capability** – Using standard XML files, agencies can export data from their in-house systems to the Regional Data Warehouse. This includes data from the *inPURSUIT* RMS, as well as other records management and crime analysis systems.
- **Browser-based Queries and Reports** – Participating agencies will have browser-based access to the Regional Data Warehouse to query data and generate reports.
- **Regional Crime Analysis** – The *inPURSUIT* Crime Analysis GIS integrates with the Regional Data Warehouse to provide crime analysts, police officers, and administrative officials with the power to visualize and identify crime patterns and analyze overall crime trends across a region.

### Support of Regional and National Data-sharing Initiatives and Standards

Denali also supports data sharing initiatives and standards at the regional and national levels, including the Global Justice XML Data Model (GJXDM). Denali has implemented interfaces based on the GJXDM. Additionally, we have implemented interfaces to regional and national level information sharing systems. The Digital Information Gateway (DIG) application also facilitates data sharing by enabling searching across disparate systems.
